Problem and its Significance

Problem

- “43% of small restaurant chains diligently tracking stock yet struggling with inefficiencies, and another 21% operating blindly without any stock visibility”
- Current market lacks integrated digital solutions that effectively bridge the gap between restaurants and suppliers

Why is it significant?

The lack of efficient solutions creates a costly ripple effect: restaurants waste valuable operational hours on manual inventory tracking or operate blindly, while suppliers struggle to predict and meet demand.

Solution

We aim to enhance the efficiency, effectiveness and ease of the procurement process in the restaurant industry by:

- Streamlining ingredient sourcing for specific menus and managing inventory
- Providing analytics to optimise ordering process
- Enabling seamless communication across borders and languages.
- Facilitating easy and secure payments through Stripe.

Solution

Suppliers' Features:

- Inventory management: product listing, editing, and stock tracking
- Sales analytics: best-selling products, low-stock alerts, total sales overview
- Order: view and manage order details and dashboard insights

Buyers' Features:

- Inventory management: weekly updates and display on the dashboard
- Supplier discovery: AI-based ingredient matching by entering menu items
- Order tracking: view order lists and statistics on purchases and spending
- Payment integration: secure transactions via Stripe

Additional Feature:

- Communication: chat function with multilingual translation capabilities

Deployment

Data Storage

Firestore

1. Real-time Data Synchronisation

- Ensures that all updates to inventory, orders, and user data are reflected instantly across the app, providing seamless and consistent data interactions

2. Authentication Services

- Offers secure authentication, ensuring that only authorised users can access and interact with the features, maintaining data security and user privacy

External APIs

1.Vertex AI API		• It specifically processes user food queries and returns structured ingredient lists and categories • Uses a system instruction to define the AI's behaviour for ingredient analysis
2.Stripe Payment API		• It handles secure payment transactions
3. Google Translation API		• Integrated into the chat function to translate messages between suppliers and restaurants • Allowing businesses in different regions to collaborate smoothly without language barriers.

Beyond the Lab

01

Prediction charting for buyer dashboard

Empowers buyers to visualise, manage, and optimise inventory with real-time data, statistical calculations, and predictive insights
